miscellaneous products

Preparing a new job in a pad printing machine involves a series of secondary activities which are nonetheless important to the entire process.

TOSH has researched and selected a range of useful and safe products, easy to use and more suitable for any production conditions, to avoid useless waste of time and its resulting higher costs.

Products

For the realization of piece holders, TOSH has developed four specific types of resins. Two of these are pastes, easy to model and to adapt to different needs, and two are more liquid: one is elastic, for irregularly shaped objects which must be grasped by light undercuts or which must not be scraped on their surfaces, and a very hard type for precise and long-lasting supports.

For the realization of films, TOSH has developed its BLK system, to use with laser printers and a special film (single matte) and its reagent.

For the production of inks and for the manipulation of inks and thinners, TOSH offers a wide range of spatulas, metal or plastic cans, dispensers, color charts and even pens to check surface tension.

For the production of clichés, whether in photopolymer or steel, our range includes simple anti-acid gloves, Boumè grade measurers, 100x microscopes to monitor etch depth and various types of engraving agents.

Products for the washing of the various parts which come into contact with the ink and which must be cleaned between production changeovers or at the end of production.

Tapes with calibrated adhesiveness for pad automatic cleaning devices, available in different widths ranging from 50 to 300 mm.
